• Statistical inference for population mean when data is NOT normal and n is large and...

Previously on CSCI 3022

• Statistical inference for population mean when data is normal and n is small and...

ullet σ is known

 \bullet σ is unknown:

The story so far, for means

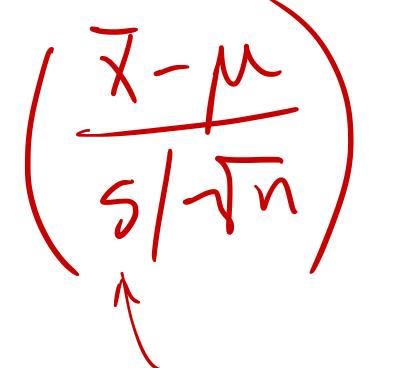

Thus far, we've talked about Hypothesis Testing & Confidence Intervals for the mean of a population in the following cases:

	"n'is large"	in is small
	$n \ge 30$	n < 30
Normal Data / Known σ	MMMMM	MMMMMMM
Normal Data / Unknown σ 5	MMMMM	MMMMMM
Non-Normal Data / Known σ		MMMMM
Non-Normal Data / Unknown σ	MMM	MUUMM

mil- 2-test m-t-test (TODAY) mi Bootstraf (after Spring Break)

Small-sample tests

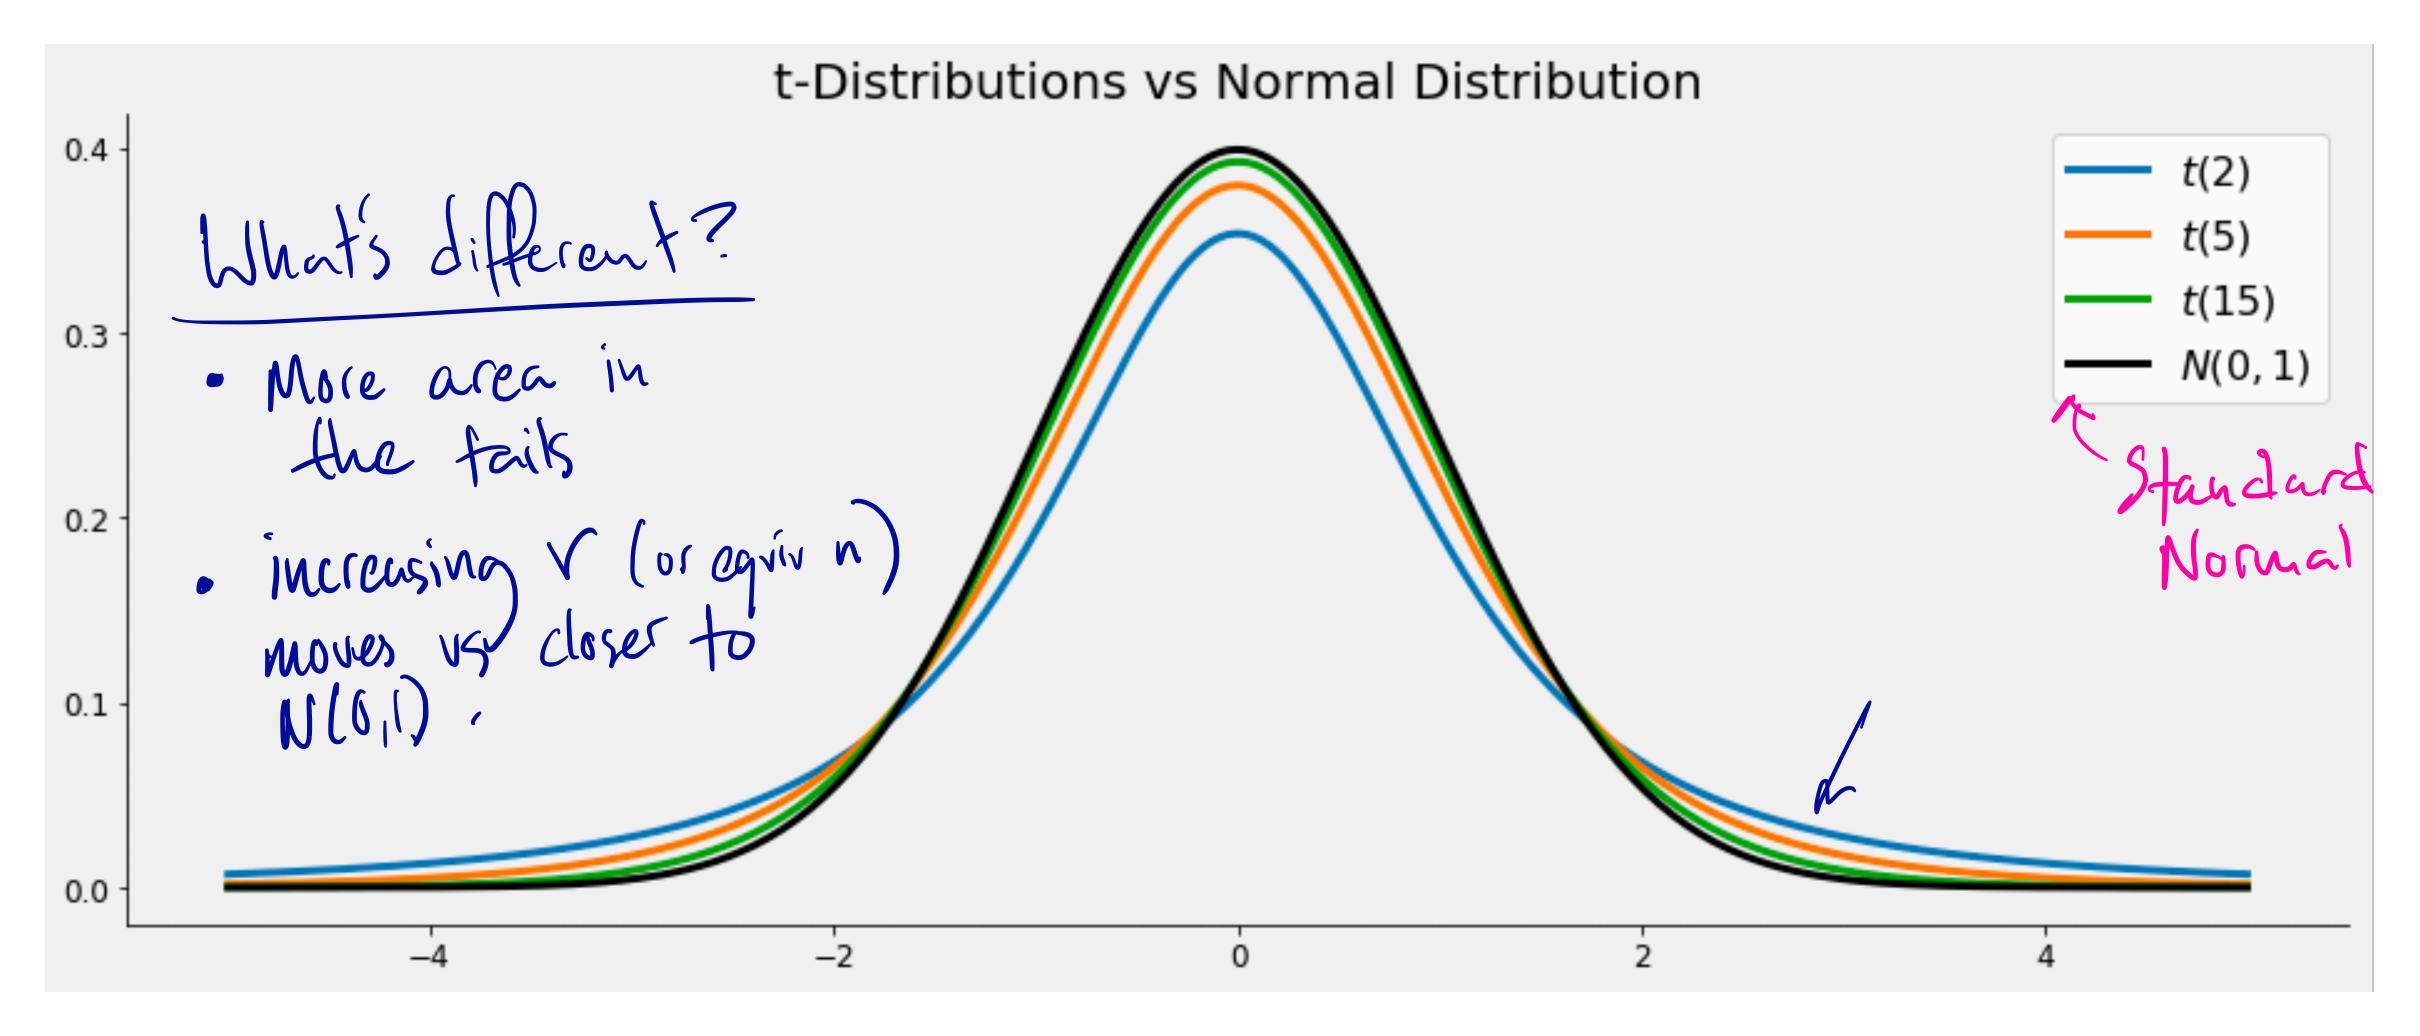

- When n is small we cannot invoke the Central Limit Theorem
- When n is small and the variance is unknown we need to do something else ...
- When \bar{X} is the sample mean of a random sample of size n from a normal distribution with mean μ , the random variable

follows a probability distribution called a **t-Distribution** with parameter $\nu = n - 1$ degrees of freedom.

The t-Distribution

The following figure shows the pdf of some members of the family of t-Distributions

• What do you notice about these t-Distributions, compared with the Standard Normal curve?

Properties of t-Distributions

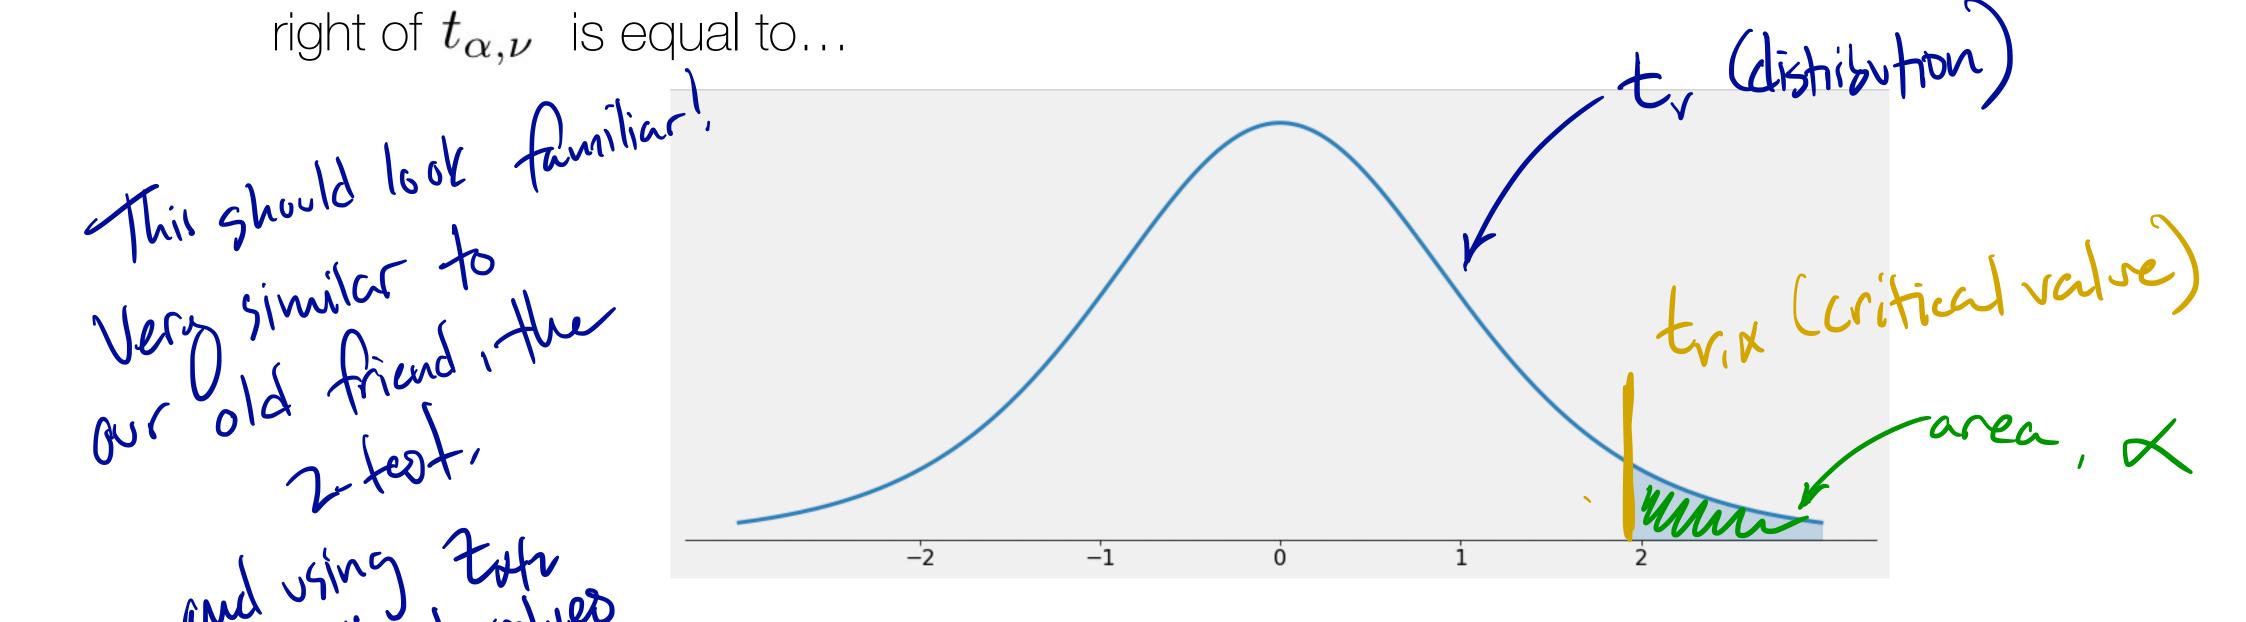

- Let t_{ν} denote the t-Distribution with parameter ν degrees of freedom (Nu in LaTeX.)
- Each t_{ν} -curve is more spread out than the standard normal distribution
- As ν increases, the spread of the corresponding t_{ν} -curve decreases
- ullet As $u o \infty$ the sequence of $t_{
 u}$ -curves approaches the standard normal curve

The t-critical value

We can extend all of our inferential mechanics to the small-sample case by introducing the socalled t-critical value, which we denote $t_{\alpha,\nu}$

Definition: the t-critical value $t_{lpha,
u}$ is the point such that the area under the $t_
u$ -curve to the

right of $t_{\alpha,\nu}$ is equal to...

Example: $t_{0.05.6}$ is the t-critical value that captures the upper-tail area of 0.05 under the t curve with 6 degrees of freedom.

The t-confidence interval for the mean

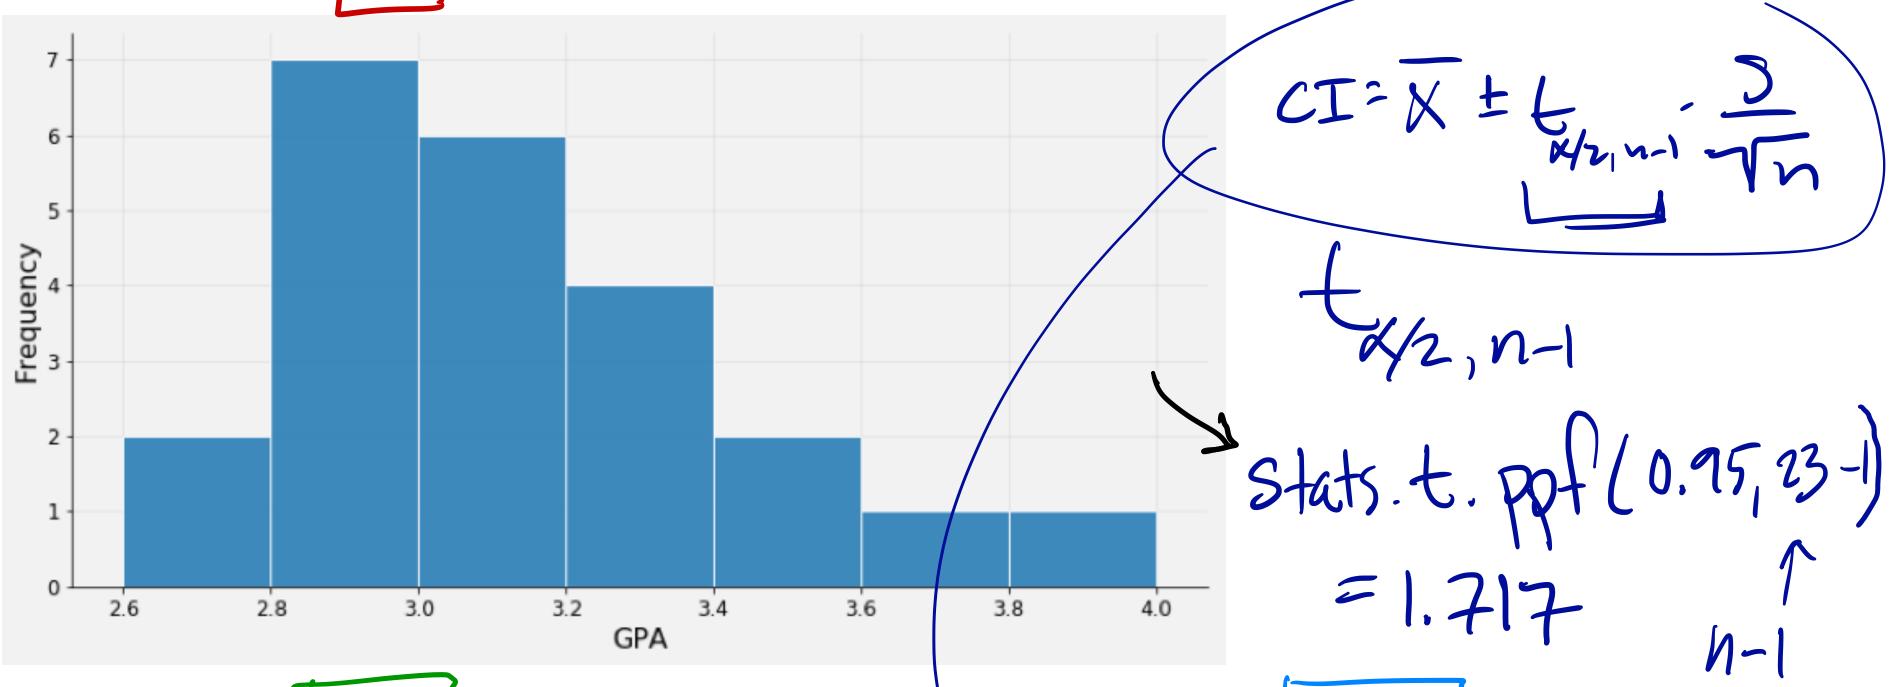

Let \bar{x} and s be the sample mean and sample standard deviation computed from the results of a random sample with of size n from a normal population with mean μ .

t-confidence interval example

• Example: Suppose the GPAs for 23 students have a histogram that looks as follows:

$$N = 23$$

 $X = 3.146$
 $S = 0.308$
 $X = 0.1$
 $X = 0.05$

• The sample mean of the data is 3.146 and the sample standard deviation is 0.308. Find a 90% confidence interval for the mean GPA.

$$X = 0.1$$
 $(1-x) \cdot 100'' \% CI$

$$3.146 = 1.717.$$
 0.308

The t-Test, Critical Regions and P-Values

 $H_{n}: \theta = \theta_{0}$

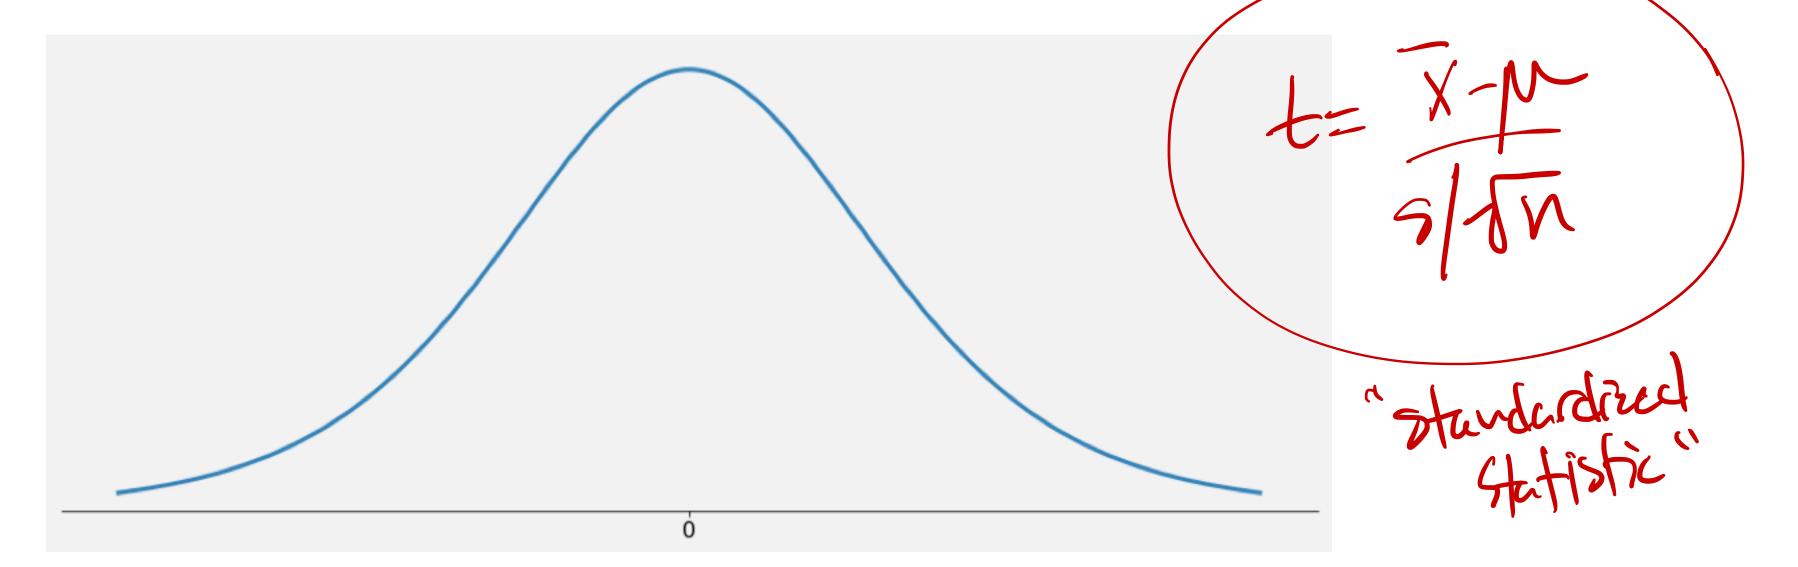

Alternative Hypothesis

Last statistic $H_1: \theta > \theta_0$ looks just live $H_1: \theta < \theta_0$ 2 fast statistics $H_1: \theta \neq \theta_0$ The substance $H_1: \theta \neq \theta_0$ The substance $H_1: \theta \neq \theta_0$ $H_1: \theta \neq \theta_0$

Critical Region Level α Test

 $t \geq t_{\alpha, \nu}$ confidence degrees of freedom $t \leq t_{\alpha, \nu}$

$$(t \le -t_{\alpha/2,\nu}) \text{ or } (t \ge t_{\alpha/2,\nu})$$

The t-Test, Critical Regions and P-Values

Alternative Hypothesis

$$H_1: \theta > \theta_0$$

$$H_1: \theta < \theta_0$$

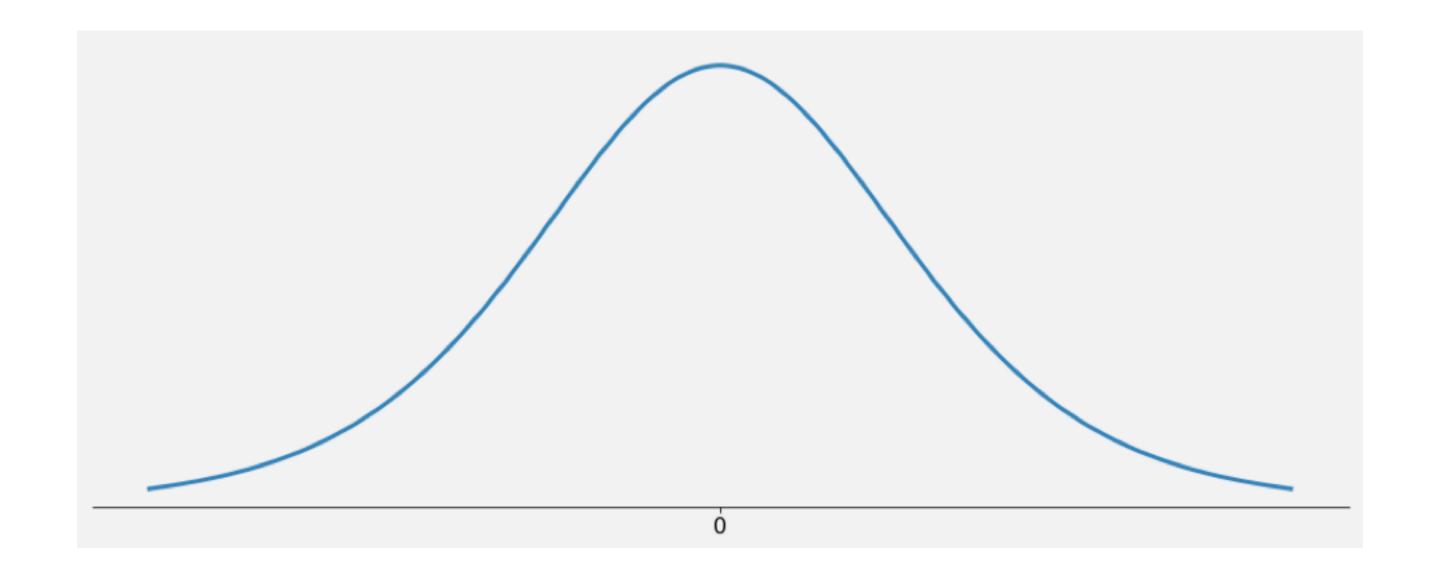

$$H_1: \theta \neq \theta_0$$

P-Value Level α **Test**

$$P(T \ge t \mid H_0) \le \alpha$$

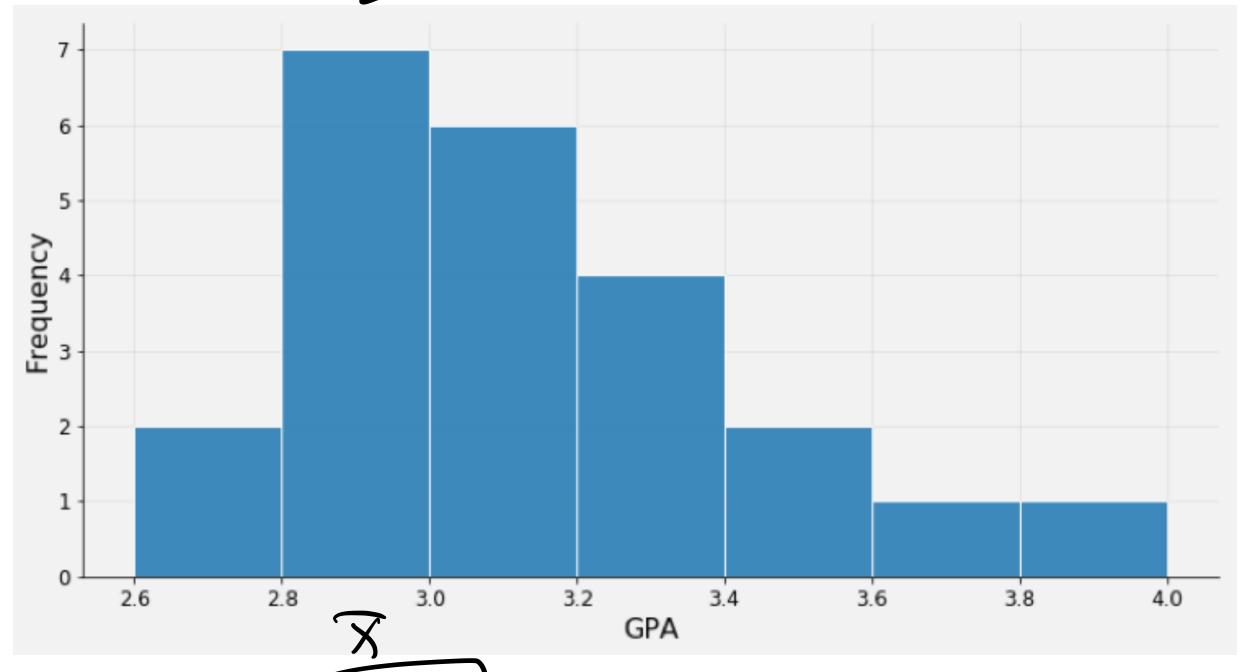

$$P(T \le t \mid H_0) \le \alpha$$

$$2\min\{P(T \le t \mid H_0), P(T \ge t \mid H_0)\} \le \alpha$$

t-Test example (p-value method)

• **Example**: Suppose the GPAs for 23 students have a histogram that looks as follows:

• The sample mean of the data is 3.146 and the sample standard deviation is 0.308. Determine if there is sufficient evidence to conclude at the 0.10 significance level that the mean GPA is

not equal to 3.30

t-Test example (p-value method)
